

Plan it tonight it *by dawn*.

Coding agents that work through the night on your own machines. Each step is checked, and a pull request is waiting by morning.

Hand it over in the evening

Write tickets the way you'd brief a colleague and pick the mission each one follows. Move tonight's work into Building and close the laptop.

Your machines, your keys

Agents run on computers you choose and sign in to the model provider with your own subscription or API key. By Dawn is never in that path.

A pull request with its proof

By morning there's a pull request with the plan it followed, the passing suites, the screenshots and the review it answered. Anything it couldn't do is flagged, never guessed.

Every step is proved

A mission is the checklist the work is held to. The tests and build have to pass, a review panel reads the diff, and screenshots come from two browsers. By Dawn checks each step, and an agent never ticks off its own.

Encrypted, and on the record

What By Dawn coordinates is end-to-end encrypted. Machines have hardware-bound identities, and every action lands in a tamper-evident audit log.

Coordination, not tokens

Your model usage stays between you and your provider. We don't resell, meter or mark it up.

A NIGHT, IN ONE LINE

23:42 TICKET BRIEFED · 02:17 FIX FOUND, 314 TESTS PASSED · 03:58 REVIEW ANSWERED · 06:05 PULL REQUEST READY
